Assignment 7: GLMs week 2 (Linear Regression and beyond)

Kathleen Mason

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

##

collapse

- 1. Change "Student Name" on line 3 (above) with your name.
- 2. Work through the steps, **creating code and output** that fulfill each instruction.
- 3. Be sure to **answer the questions** in this assignment document.
- 4. When you have completed the assignment, Knit the text and code into a single PDF file.
- 5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your last name into the file name (e.g., "Salk_A06_GLMs_Week1.Rmd") prior to submission.

The completed exercise is due on Tuesday, February 25 at 1:00 pm.

Set up your session

- 1. Set up your session. Check your working directory, load the tidyverse, nlme, and piecewise SEM packages, import the raw NTL-LTER raw data file for chemistry/physics, and import the processed litter dataset. You will not work with dates, so no need to format your date columns this time.
- 2. Build a ggplot theme and set it as your default theme.

The following object is masked from 'package:dplyr':

```

NTL-LTER test

theme_set(mytheme)

Research question: What is the best set of predictors for lake temperatures in July across the monitoring period at the North Temperate Lakes LTER?

- 3. Wrangle your NTL-LTER dataset with a pipe function so that it contains only the following criteria:
- Only dates in July (hint: use the daynum column). No need to consider leap years.
- Only the columns: lakename, year4, daynum, depth, temperature C
- Only complete cases (i.e., remove NAs)
- 4. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature. Run a multiple regression on the recommended set of variables.

```
#3
ChemPhys.Wrangled <-
  ChemPhys %>%
  select(lakename, year4, daynum, depth, temperature_C) %>%
  #filter for Julian days in July and surface measurements
  filter(daynum > 181 & daynum < 213 ) %>%
  #code won't work if there are NAs
  na.exclude()
ChemPhys.TempAIC <- lm(data = ChemPhys.Wrangled, temperature_C ~ year4 + daynum + depth)
step(ChemPhys.TempAIC)
## Start: AIC=26016.31
## temperature_C ~ year4 + daynum + depth
##
##
            Df Sum of Sq
                                  AIC
                            RSS
## <none>
                         141118 26016
## - year4

  5. What is the final set of explanatory variables that predict temperature from your multiple regression?
    How much of the observed variance does this model explain?
    Answer: Year, daynum, and depth are all explanatory variables of temperature. These variables
    account for 74% of variance in temperature.
  6. Run an interaction effects ANCOVA to predict temperature based on depth and lakename from the
    same wrangled dataset.

```

7. Is there a significant interaction between depth and lakename? How much variance in the temperature observations does this explain?

Answer: Yes, there is significant interaction between depth and lakename. These variables and their interaction account for 79% variance in temperature observations.

8. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```
#8
Temp.depthplot <- ggplot(ChemPhys.Wrangled, aes(x = depth, y = temperature_C, color = lakename)) +
    geom_point(alpha=0.4, shape=1) +
    geom_smooth(method = "lm", se = FALSE) +
    ylim(0, 35)+
    labs(x="Depth (m)", y= "Temperature (C)")
print(Temp.depthplot)</pre>
```

Warning: Removed 73 rows containing missing values (geom_smooth).

- 9. Run a mixed effects model to predict dry mass of litter. We already know that nlcdClass and functionalGroup have a significant interaction, so we will specify those two variables as fixed effects with an interaction. We also know that litter mass varies across plot ID, but we are less interested in the actual effect of the plot itself but rather in accounting for the variance among plots. Plot ID will be our random effect.
- a. Build and run a mixed effects model.
- b. Check the difference between the marginal and conditional R2 of the model.

```
Litter.MixedE <- lme(data = Litter,</pre>
                  dryMass ~ nlcdClass * functionalGroup,
                   random = ~1|plotID) #with random effect
summary(Litter.MixedE)

#marginal rsquared = 0.2465, conditional rsquared = 0.2679
  b. continued... How much more variance is explained by adding the random effect to the model?
    Answer: 2 % -difference between marginal(fixed effect) and conditional(fixed effect and random
    effect) rsquared
  c. Run the same model without the random effect.
  d. Run an anova on the two tests.

#lower the AIC, the better model > Litter.MixedE (with random effect) the better model
```

d. continued... Is the mixed effects model a better model than the fixed effects model? How do you know?

Answer: The mixed effects model is a better model based on the anova between the two modesl, mixed effects has a lower AIC. The pvalue tells us whether they have a significantly different fit, and the resultant pvalue from the anova says there is a significant difference between the models.
